

# Audio Separator Plugin

Alex Nishio and Michael Szostak

# Design

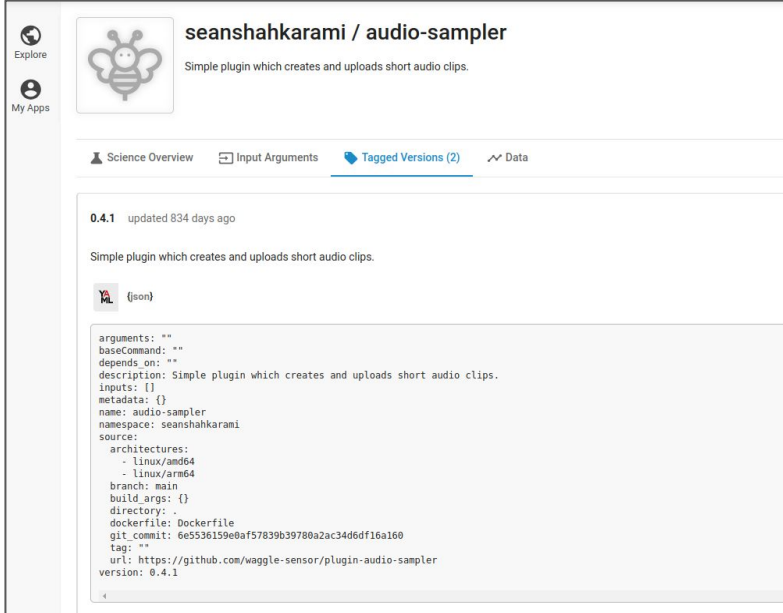

Credit to Michael

*Steps 1~3 are uploaded on Michael's GitHub page  
Steps 4 and 5 are future improvements*

1. Microphone Node is activated by Docker Container
2. Field Recordings are sent to a database
3. An inference model is ran on the database that analyzes the wav files and keeps only the important wav files
4. Classification Model
5. User Interface

# Microphone Portion (Step 1 and 2)

The screenshot shows the plugin page for 'seanshahkarami / audio-sampler'. It includes a description: 'Simple plugin which creates and uploads short audio clips.' and a version history table showing version 0.4.1 as the latest, updated 834 days ago. Below the description is a metadata section with details like name, namespace, source, architectures, and build arguments.

seanshahkarami / audio-sampler

Simple plugin which creates and uploads short audio clips.

0.4.1 updated 834 days ago

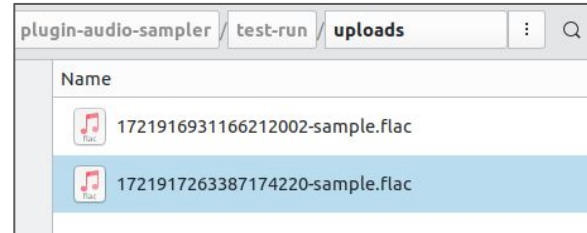

Simple plugin which creates and uploads short audio clips.

version: 0.4.1

Sean's Implementation of the Audio Sampler can be directly used

```
def main():  
    parser = argparse.ArgumentParser()  
    formats = ["flac", "ogg", "wav"]  
    parser.add_argument("--format", default=formats[0], choices=formats, help="sample file format")  
    parser.add_argument("--rate", default=300, type=float, help="sampling interval in seconds")  
    parser.add_argument("--duration", default=30, type=float, help="sample duration in seconds")  
    args = parser.parse_args()  
  
    logging.basicConfig(  
        level=logging.INFO,  
        format='%(asctime)s %(message)s',  
        datefmt='%Y/%m/%d %H:%M:%S')  
  
    with Plugin() as plugin:  
        sample_and_upload(args, plugin)
```

Can tune the time intervals and length of clip here

The screenshot shows the 'plugin-audio-sampler' interface with tabs for 'test-run' and 'uploads'. The 'uploads' tab is active, displaying a list of uploaded audio clips. Each entry includes a file icon, a unique ID, and the filename.

plugin-audio-sampler / test-run / uploads

Name

	1721916931166212002-sample.flac
	1721917263387174220-sample.flac

30 second clips recorded in 5 min intervals  
stored in a file storage system

# Results of Peak Finder Script (Step 3)

More information can be found in Michael's repository

Red lines indicate peak sounds (important sounds)

Proof that the separated files are present

# Future Improvements

- Finishing Steps 4 and 5
  - Add a classification model to distinguish audio files
  - Create a UI to make it more user friendly
